

Hearing Conservation

The purpose of the Hearing Conservation Program is to prevent occupational noise exposures which could lead to noise-induced hearing loss and to comply with existing federal occupational noise exposure regulations. Employees who experience an average exposure of 85 decibels, Time-Weighted Average (TWA), over an 8-hour work shift are included in Lehigh University's Hearing Conservation Program that includes training and annual hearing tests (audiograms). The audiograms are performed at Lehigh Valley Health Network, Healthworks.

The Hearing Conservation Training Program is available online at the Environmental Health and Safety website.
